Sound lies at the very center of speech communication. A sound wave is both the end product of the speech production mechanism and the primary source of raw material used by the listener to recover the speaker's message.

Normally, sound intensity is measured as a relative ratio to some standard intensity,  $I_0$ . The response of the human ear to sound waves follows closely to a logarithmic function of the form  $R = k \log I$ , where R is the response to a sound that has an intensity of I, and

Acoustics: the study of sound waves Sound is the phenomenon we experience when our ears are excited by vibrations in the gas that surrounds us. As an object vibrates, it sets the surrounding air in motion, sending alternating waves of compression and rarefaction radiating outward from the object.

### **Acoustics: the study of sound waves - CCRMA**

The sound level depends on the distance between the sound source and the place of measurement, possibly one ear of a listener. The sound pressure level Lp in dB without the given distance r to the sound source is really meaningless .

used for a slightly greater reach or for more ambient sound rejection. Balanced low-impedance output is used exclusively, and the sensitivity of a condenser microphone is desirable because of the greater distance between the sound source and the microphone. Application of choir microphones falls into the category known as "coverage".

## **Microphone Techniques for Recording (English)**

The sound pressure decreases with  $1/r$  at a distance from the sound source. The sound intensity drops with  $1/r^2$  at a distance from the sound source. This is often confused and misunderstood because of the principal difference between the sound pressure as a sound field quantity and the sound intensity as a sound energy quantity is not known.

## **How does the sound decrease with distance? sound pressure**

to a distance from the source equal to about a wavelength of sound or equal to three times the largest dimension of the sound source (whichever is the larger). 1.1.2.3.

## **1 FUNDAMENTALS OF ACOUSTICS - WHO**

The sound pressure that we hear, or measure with a microphone is dependent on the distance from the source and the acoustic environment (or sound field) in which sound waves are present. This in turn depends on the size of the room and the sound absorption of the surfaces. So by measuring sound pressure we cannot necessarily quantify how

the sound of distant pdf In physics, sound is a vibration that typically propagates as an audible wave of pressure, through a transmission medium such as a gas, liquid or solid.
