Atomic spectroscopy is the study of the electromagnetic radiation absorbed and emitted by atoms. Since unique elements have characteristic (signature) spectra, atomic spectroscopy, specifically the electromagnetic spectrum or mass spectrum, is applied for determination of elemental compositions. It can be divided by atomization source or by the type of spectroscopy used.

### **Atomic spectroscopy - Wikipedia**

Laser-induced breakdown spectroscopy (LIBS) is a type of atomic emission spectroscopy which uses a highly energetic laser pulse as the excitation source. The laser is focused to form a plasma, which atomizes and excites samples. The formation of the plasma only begins when the focused laser achieves a certain threshold for optical breakdown, which generally depends on the environment and the ...

Artwork by Dean Ellis (for The Last Hurrah Of The Golden Horde); There is a nice basic overview of propulsion systems here.. You can spend lots of time researching spacecraft propulsion systems.

The main advantage of particle beam weapons is they have penetration that make lasers look like throwing a handful of thistle down. The main drawbacks of particle beam weapons is they are power hogs, they are difficult to reduce to pistol size, and Terra's atmosphere will scatter enough of the beam to give the firer a lethal dose of radiation.

The primary objective of this book is to present and develop the fundamentals and principal applications of plasma physics, with an emphasis on what is usually called high-temperature plasma physics where the plasma is nearly fully ionized with nearly negligible effects of neutral particles on the plasma behavior.
